

ΠΤΕΛ - PrimeTel: Casting of underwater cable in Geroskipou beach
(16/6/2009)

The casting of the “Hawk” optical fibres cable system, which is part of the global underwater cable system of Reliance Globalcome, at the Geroskipou beach took place on Friday, 12/6/2009.

PrimeTel entered into a contract with Reliance Globalcom, which owns and manages the biggest private underwater cable system of optical fibres in the world, in order to use its network and to connect Primetel with the rest of the world.

With the arrival of the cable in Cyprus, PrimeTel secures access and acquires capacity of 5Gbps (32 STM-1) in the cable system, with the ability for further upgrading with favourable terms, which will give it the opportunity to offer faster internet and lower prices.

It is worth noting that with this project, the Company creates an alternative-independent infrastructure for a connection with the international network, which secures the electronic communications of the county and strengthens the island's role as a telecommunications hub in the area, with access to other significant telecommunication hubs around the world.
